A PDF file describing what other kinds of automated tests can be performed in this application (functional and non-functional), how would you maximize the value of testing in this application(testing techniques), all other considerations you think it's important.

Functional:

- Would be value to use Unit Test for another feature which has on the system;

Non Functional:
- Security testing based in session, like: SQL Injection.
- Performance and Load testing;

As far as I can see we also try to maximize our test cases automated as possible as this will increase value to the product and reduce the risk of not testing any area. Including all idea above this document should be maximize the value of this product.
